

## QuNexus Demo Lab Quickstart Guide

May, 2014

The QuNexus Demo Lab provides a visual representation of the pressure and tilt sources for each of the keys.

To use the Demo Lab, open the application, plug a QuNexus into your computer via USB, and switch to factory preset D. Change to preset D by tapping the Shift/Prgm button and then pressing the Tilt/D button.

Now the Demo Lab will display the pressure and tilt of the keyboard when you play it.

If you'd like to use the "QuNexusDemoLabSensorView" preset that comes with the Demo Lab, try importing the preset into the QuNexus Editor and sending it to one of the presets slots (A, B, C, or D).

Note: this application does not provide audio.
